

ONEVISION VOYAGER

AUTOMATED, 24/7 ONLINE FILE SUBMISSION AND APPROVAL – A NEW LEVEL OF CONVENIENCE FOR YOUR CUSTOMERS

voyager

OneVision Voyager is the bridge that connects customers with printers and publishers – automatically and effortlessly. It gives customers the ability to easily and securely upload and submit files 24/7 via the Internet and makes the process of submitting ad files easier than ever before.

No matter whether your customers submit PDFs, PostScript files or even photos – depending on requirements and infrastructure, the submitted file can be checked according to the requested production specifications. The integrated approval process allows each customer to accept or reject the file or even send the already controlled, corrected and optimized file on for further manual modification.

As an integrated solution that combines Web-based services and Rich Internet Application (RIA) technology, OneVision Voyager offers several features and benefits:

- Automated file submission for data checking to reduce errors
- Approval of successful jobs
- Flexible 24/7 availability
- Rich Internet Application (RIA)-based or browser-based, depending on your customers' needs and preferences
- Improved customer service without additional staff

TIME IS MONEY

Years ago, business was local. Employees were present during specific working hours to communicate via the telephone. Times change. Mobile phones, instant messaging, wireless Internet devices and other technology removes standard working hours and reinvents where and how work gets done. Response times are no longer counted in days, but minutes – and every second is crucial.

AUTOMATE FILE SUBMISSION – FILES GO FROM DESKTOP TO PRODUCTION IN SECONDS

No matter whether files or photos are intended for print production or Web publishing, your customers want immediate feedback concerning file status. Waiting for answers slows processes, and so does repeating a process – especially at the last minute, right before production.

Every additional person required in approval processes limits your speed and efficiency. With OneVision Voyager, printers and publishers can offer customers and production staff immediate, automatic response about a file's job status. Just submit a file using Voyager, and it can be routed to other solutions within the workflow that provide file control, correction and normalization or image enhancement. Depending on the required level of automation, files can be cross-checked using information in the booking system.

THE BENEFITS OF A CLIENT-BASED APPLICATION

OneVision Voyager is both a browser-based and a Rich Internet Application (RIA)-based application, which offers customers two ways to upload files using a PC or a Mac. The browser-based “thin client” requires no application to download, while the more comprehensive RIA “smart client” can be easily downloaded. When a customer accesses the RIA Voyager application on their desktop, it provides the features and functionality of traditional desktop applications, yet the processing is performed by your workflow system.

Voyager eliminates the need to check email for a file submission verification receipt, because customers have access to a single point of focus for all portal interactions.

SEAMLESS FILE LOGISTICS – FROM MOBILE DEVICE TO PRESS OR STORAGE

Voyager benefits from OneVision Workspace, the back-end that allows printers and publishers to remotely monitor, track, manage, and control every job throughout the production process and provides streamlined views into every job within the prepress production cycle.

The Voyager RIA-based application also offers simple drag-and-drop file routing as well as Hot Folder support so the user can simply “drop” a file and automatically enter it into the process.
